

New Product Developed in Effort to Prevent Sudden Infant Death Syndrome

LAWRENCE, N.Y. – Oct. 24 (SEND2PRESS NEWSWIRE) – SIDS ALERT Infant Position Monitor, a breakthrough method of detecting if an infant has maneuvered itself into a SIDS (Sudden Infant Death Syndrome) prone position, is now available to the public. The unique, patented technology eliminates the concern of new and prospective parents concerning the possibility of SIDS and the terrible aftermath of this horrifying malady.

Send2Press® Newswire

SIDS ALERT Infant Position Monitor is safe, convenient and consists of two parts, a transmitter and a receiver. The small transmitter is securely attached to a baby's diaper causing no discomfort.

The receiver, about the size of a cellular phone, is for a parent or caregiver to place on a nightstand, worn on a belt, or lanyard and emits an alarm each time the infant has moved into a SIDS prone position. The SIDS ALERT Infant Position Monitor is a 24 hour a day, potentially life saving alarm system that has been thoroughly tested, is completely reliable and safe to use.

The American Academy of Pediatrics recommends that all infants be placed on their backs in an effort to avoid the tragedy of SIDS that affects 2,500

families in the United States annually.

The SIDS ALERT Infant Position Monitor, by alerting a parent or caregiver of a position change, is a safe and effective way to prevent an infant from extended periods on their stomach.
