

Power the new Apple iPhone while In-flight via the Coach Seat Music Jack

LOS ANGELES, Calif. – June 27 (SEND2PRESS NEWSWIRE) – InflightPower.com announced today the introduction of a new product for those travelers interested in recharging the new Apple(R) iPhone(R) while on the fly. The InFlight Power(TM) iPhone recharging cable has just been released for market sales.

The patented device works by storing energy from the passenger seat music jack; it then outputs regulated power to the attached USB charging cable/connector. The InFlight Power(TM) cable works on first class and business/coach class seats.

Engineered for safe use on an airplane, bus or train; the InFlight Power(TM) cable weighs only 3 oz., is small and ultra portable.

The unique product is designed to save money on expensive disposables / booster packs and replaces weighty, cumbersome, brick-sized chargers. The interchangeable InFlight Power(TM) USB cable can also recharge cell phones, and game player units.

“A must-have for the business traveler or anyone on the move who wants to keep their power charge,” said the product’s inventor, Thomas Giannulli MD, MS.

The product has received rave reviews from AIRFAX.com and is available online at the company’s website.
