

AfterLogic Announces Free WebMail Pro 5-user License

NEWARK, Del., Nov. 24 (SEND2PRESS NEWSWIRE) – AfterLogic Corporation (www.afterlogic.com) today made available for free download a fully functional version of its very popular webmail application, WebMail Pro, licensed for up to 5 users. The application comes with a perpetual license, which never expires, and the installation package can be downloaded at no cost from the company's Web site.

AfterLogic WebMail Pro is a server-based Web application, accessible by users over the Internet. After downloading, the software is installed on a Web server, running either Windows or Linux operating system. Once the system is installed, users are able to retrieve, send and manage their e-mail using a standard browser, without installing any additional software. AfterLogic WebMail Pro is able to connect to multiple mail servers simultaneously, and, from a mail server's perspective, the application appears indistinguishable from any other e-mail client.

In addition to facilitating fast and efficient communication between a browser and a mail server, supporting SMTP, POP3 and IMAP protocols, the application comes with a rich text (WYSIWYG) editor, an address book and a full-featured calendar. WebMail Pro's intuitive, Ajax-based, multi-domain user interface emulates standalone mail clients and supports virtually all modern Web browser versions. Other features include folders and sub-folders; attractive skin designs; localization settings; multiple mail accounts per user; domain-level branding; a Web-based administration panel, and a Developer's API for easy integration with other systems.

International settings, including support for right-to-left languages, position the software for worldwide distribution, further encouraged by the zero price tag. The application is distributed under a commercial license, which covers three basic uses of the software: (1) WebMail Pro may be installed as a standalone application for internal use within any business or organization, (2) developers may integrate WebMail Pro with other internal software systems, or (3) WebMail Pro may be integrated by Independent Software Vendors (ISVs) with larger and more complex proprietary SaaS solutions and made available to their clients under a hosted service offering. Additional licensing options are designed to address special needs of ISPs and hosting providers.

A live demo is available at:
