

# DataNumen SQL Recovery 6: Exhaustive Repair of Inaccessible Data Files

NEW YORK, N.Y., July 15, 2021 (SEND2PRESS NEWSWIRE) – DataNumen company announces the new version of its multilingual SQL repair solution that retrieves maximum data from damaged MDF and NDF files. In addition to the main functions, DataNumen SQL Recovery 6 can now remember database connection settings, recover primary keys and the nullable property of a column.

Send2Press® Newswire

Microsoft SQL Server is one of the most popular relational database management systems: large corporations and SMBs use it to store and retrieve valuable business data – information on transactions, manufacturing, logistics, personnel, etc. Unfortunately, MDF and NDF data files used by MS SQL Server can easily get damaged or corrupt, making the database information inaccessible. It is advisable to have a reliable SQL recovery tool at hand because backup files sometimes get damaged, too.

DataNumen SQL Recovery is a multilingual solution based on smart algorithms: it performs thorough byte-by-byte analysis to recover maximum data. The program restores the structure and the data of the tables, recovers deleted records, views, indexes, rules, triggers, defaults, scalar functions, stored

procedures, and much more. It can even recover encrypted objects without any password. As **compared** to the competing programs, DataNumen SQL Recovery has the highest average recovery rate of 92.6%, while the second place is only 63.2%.

The new version of the program offers smoother operation and enriched functionality. It can now remember database connection settings, so the user does not have to configure them after recovery. Besides, the retrieved data includes the nullable property of a column and primary keys (the previous versions could not restore them).

#### **DataNumen SQL Recovery at a glance:**

- recovers corrupt, damaged, and accidentally deleted MDF and NDF files
- supports all versions of MS SQL Server
- retrieves the table structure and all the data types including XML
- performs batch recovery
- repairs large files up to 16 TB
- recovers data files on VM disks, ISO images, etc.
